Public transportation is refitting vehicles with finger protection

The influence of the World Cup on public transportation is already noticeable. Most public transportation services in Germany's major cities have started with the refitting of their vehicles and are equipping these with jamming detection and protection systems made by Hübner GmbH.

The finger protection systems prevent jamming of passengers or objects during the closing of the door. Jammed persons or objects are recognized and the closing process is stopped. The jamming detection and protection systems are able to detect objects with a mere thickness of 5 mm. This increases the safety for the passengers.
